

Ansible for z/OS

Provision Data Sets for an Application Developer

APPLICATION DEVELOPER SETUP

There are many ways a software developer might organize their files, but we are going to make a set of assumptions for purposes of this exercise.

z/OS application developers use PDSE data sets, or LIBRARY type data sets, for most of their day-to-day files.

This is roughly analogous to organizing your source files, configuration files, and notes in separate subdirectories.

As an infrastructure engineer, you may set up file structures like this for multiple application developers as well as for the applications themselves – dev, test, staging, prod, break-fix, and so forth.

In our lab environment, you can only work with your own z/OS userid, and you aren't authorized to touch z/OS system resources like CICS and DB2. But by setting up the libraries for a hypothetical application developer, you'll have the basic structure for Ansible playbooks that you can re-use for real work.

LAB 28: PROVISION DEVELOPER DATA SETS

Follow the instructions for Lab 28 in labs/labs.md in the course repo.

WHAT YOU KNOW AND WHAT YOU CAN DO

- You can apply good software engineering principles to your Ansible artifacts, in the spirit of infrastructure as code

WHAT'S NEXT

- Collect system information from z/OS
